SUBJECT: Review proposed changes and protocol for
fish embryo-larvae study.

The Ecological Effects Branch (EER) has reviewed the protocol submitted by Mobay pertaining to the offtanol trout early life stages study. All of the major points that were discussed during the meeting on December 1982, are included in this new protocol. The significant deficiencies in the previous study (Rexrode 10/4/82) included the lack of information regarding fish growth (weight and length of survivors), and the excessive control mortality during the "swim-up" stage. The present protocol addresses the fish growth problem by including the length and weight of all survivors in each replicate for each concentration. This office would also require that the time interval between each fish development stage (embryo-larvae-swim up) be included in the final report. Mobay's present protocol appears to be acceptable with the addition of the above suggestions.
